meshIQ

UX / UI CASE STUDY

PLATFORM REDESIGN · MESSAGING, EVENT & STREAMING

One platform for data in motion.

Unifying Manage, Observe, Track and Control Center into a single, consistent meshIQ experience.

ROLE
UX/UI Designer

PROJECT TYPE
Product redesign

PRODUCTS
Manage · Observe · Track · Control Center

DELIVERABLES
Design system · Hi-fi UI

01 · OVERVIEW

Bringing a suite of products together as one platform

meshIQ helps large enterprises monitor and manage their data in motion across messaging and streaming technologies such as IBM MQ, Apache Kafka, RabbitMQ, ActiveMQ, TIBCO and Solace.

Its product suite includes **Manage, Observe, Track** and **Control Center**, along with AI-driven operations. This project was a UX and UI redesign with one goal: bring these separate products together under a single, unified **meshIQ Platform** experience.

MY ROLE	RESPONSIBILITIES
UX/UI Designer	Product research, problem definition, ideation, design system creation, high-fidelity mockups and testing support.

02 · THE CHALLENGE

Customers saw a set of tools, not one platform

Over time, each meshIQ product had grown into its own application with its own URL, login, layout and visual style. Many customers use more than one product, and different users have different roles and permissions. As a result, customers saw meshIQ as **a set of separate tools** rather than one platform. This weakened the brand and made everyday work slower and more fragmented.

Key pain points, from customer feedback

Many URLs, many logins
A separate address and sign-in for every product.

Inconsistent experience
Different UI and interaction patterns in each product.

No easy movement
No quick way to switch between products during a task.

Dated visuals
Limited data analytics and dashboard views.

Weak brand identity
Users identified with individual products, not with meshIQ.

Permission complexity
Different roles and access levels spread across separate apps.

03 · PROBLEM STATEMENT

HOW MIGHT WE

How might we help multi-product customers see and use meshIQ as one connected platform, with a single access point, a consistent experience and clear role-based access?

04 · DESIGN PROCESS

Five steps from product insight to a living system

01

Product Research

Because this was a redesign, direct user research wasn't possible. I studied the existing products in depth (workflows, features, user roles and permission models) and combined this with pain points reported by customers and internal teams.

02

Define

I turned these findings into a clear problem statement and set the design goals: unify access, create consistency, modernize the visuals and strengthen the meshIQ brand.

03

Ideation

I explored concepts for platform-level navigation, a product switcher, unified login and dashboard layouts, and shaped them into user flows and wireframes.

04

Design System & Mockups

I built a shared design system (colors, typography, components, data visualization and interaction patterns) and applied it to high-fidelity mockups for every product.

05

Testing & Maintenance

I validated the designs with stakeholders and customer feedback, refined the details, and maintained the design system as the products evolved.

05 · THE SOLUTION

What the redesign delivers

01 One platform, one URL
Every product lives under the meshIQ Platform, reachable from one place.

02 Single Sign-On (SSO)
Log in once and access every product you are entitled to.

03 Product switcher
The app grid in the header moves users between products. The product badge under the logo always shows where they are.

04 Consistent, modern UI
One dark interface, one green accent and shared components across all products.

05 Data-rich dashboards
Custom dashboards with KPI cards, charts and live tables for queues and monitors.

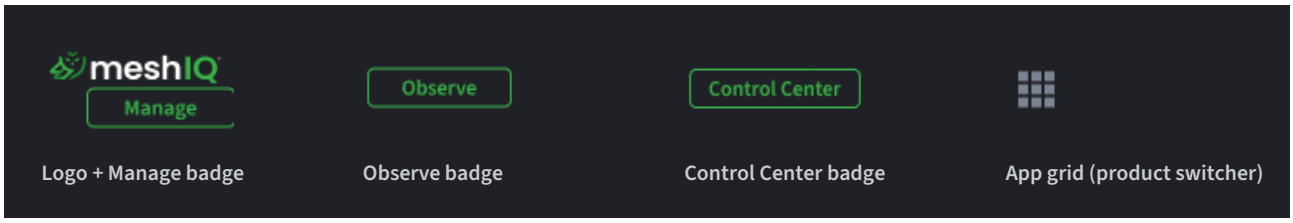

06 AI agent assistance
AI agent support across the products to help users find issues and act faster.

07 Refined interactions
Clearer actions, states and visual feedback, such as status chips and filters.

08 Shared design system
One library of tokens and components for faster, consistent delivery.

Consistent branding across every product

Every product now uses the same meshIQ logo and header, with a green badge naming the current product.

06 · DESIGN SYSTEM

Foundations

Colors below are taken directly from the product UI. Green is the single brand and action color; dark neutrals build depth from canvas to panel to raised surface.

BRAND & ACTION

Green 500	Green 700	Login black
#38B449	#158B13	#000C00

DARK SURFACES

Canvas	Panel	Raised	Selected row
#0E0F11	#202126	#2A2E34	#4D545E

STATUS

Success	Warning	Error	Alert orange
#38B449	#E8B93F	#B54333	#D16442

DATA VISUALIZATION

Blue	Sky	Teal	Gold	Violet
#289CC3	#35C1F0	#29AD94	#C09B3A	#654DCF

Typography · Source Sans 3

Page title — Source Sans 3 · Bold · 22 / 28

Panel heading — Source Sans 3 · Bold · 15 / 20

Table header & labels — Source Sans 3 · Semibold · 12 / 16

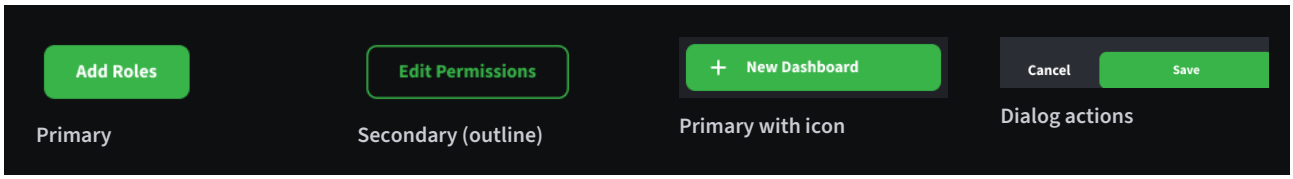

Body and table cells — Source Sans 3 · Regular · 11 / 16

Helper text, timestamps, results — Source Sans 3 · Regular · 9 / 12

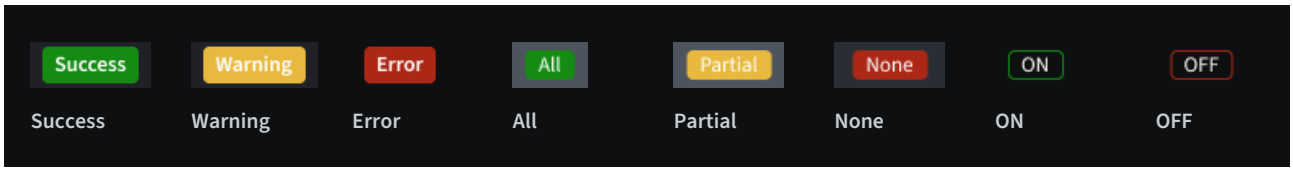

Components

Core components used across Manage, Observe and Control Center, shown as they appear in the product.

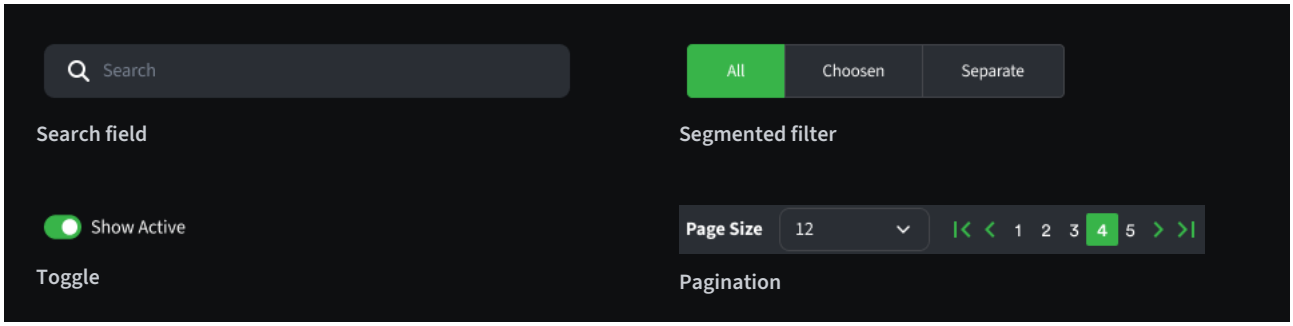

Buttons

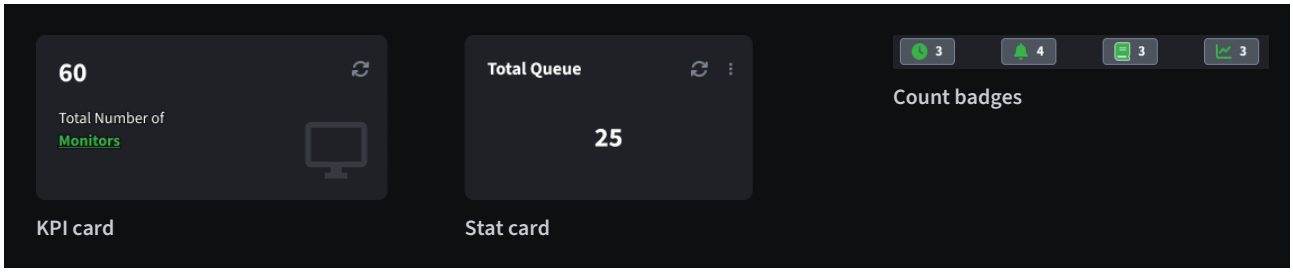

Status chips

Inputs & controls

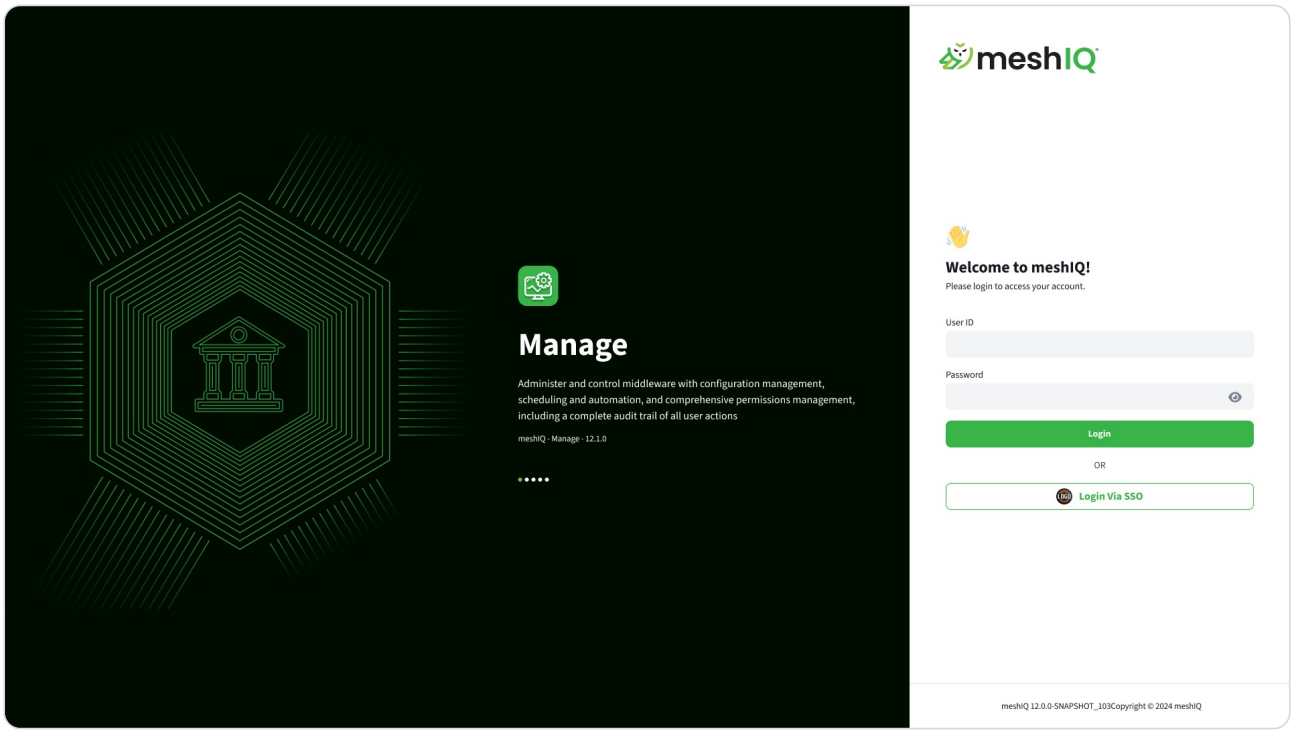

Cards & data

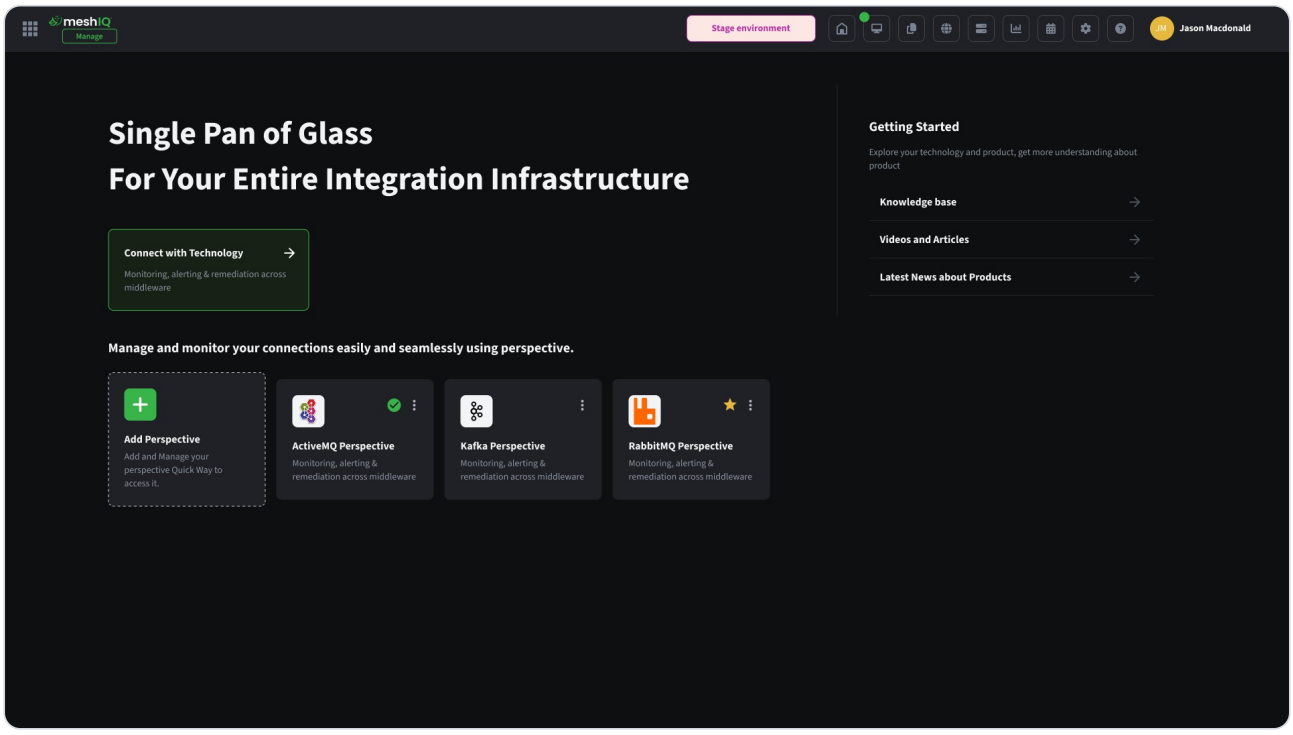

07 · UI HIGHLIGHTS

Unified login with SSO

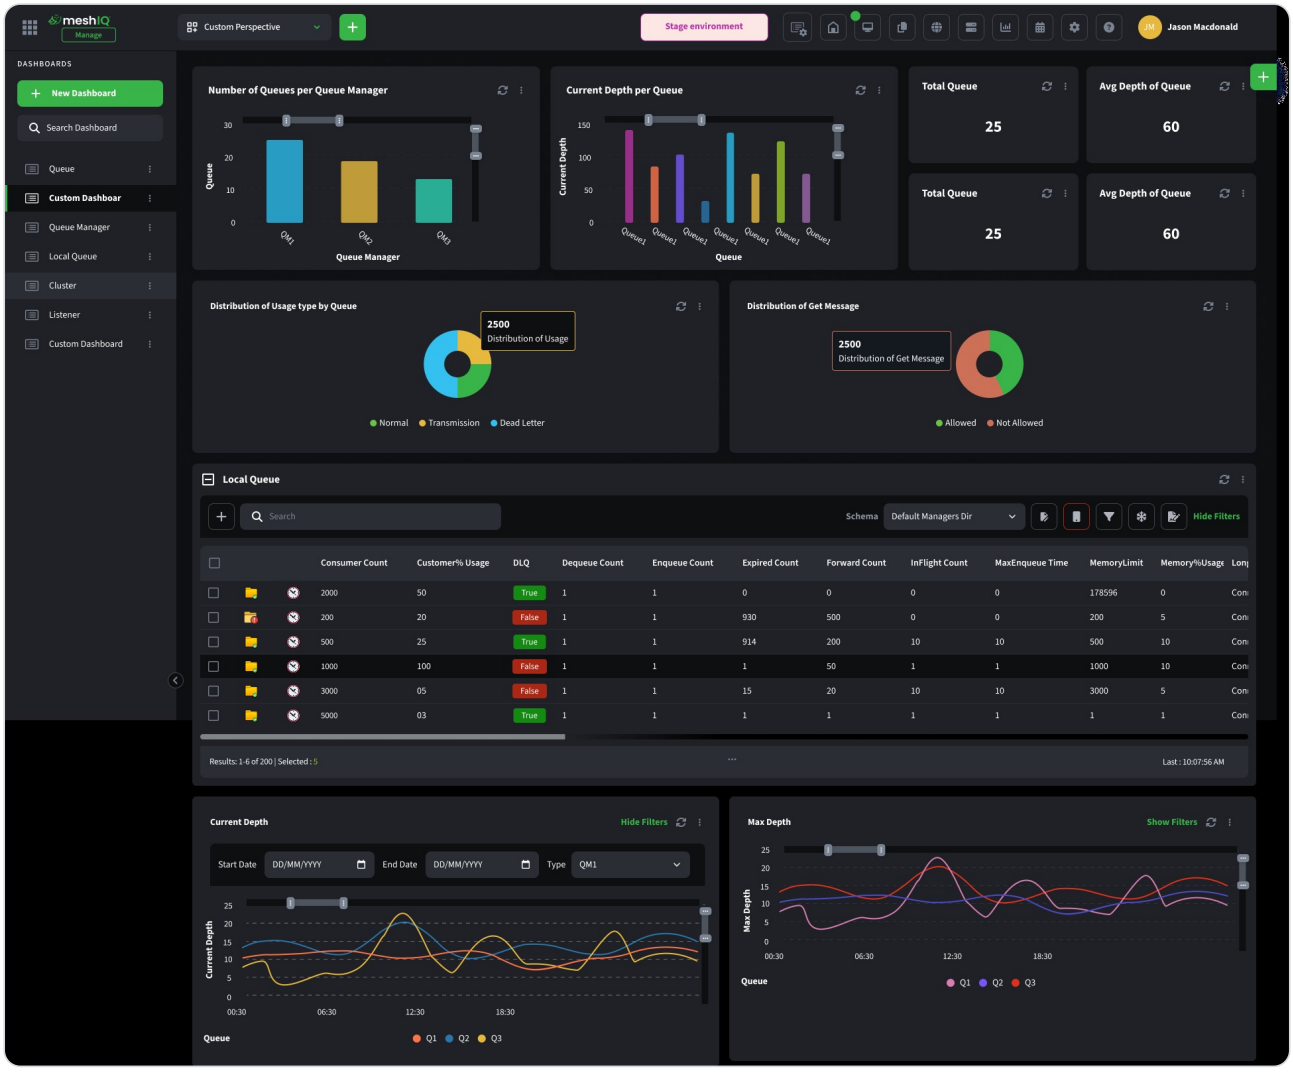

A single login for the platform, with a **Login via SSO** option. The left panel introduces each product (here, Manage) in a consistent branded style.

Manage home

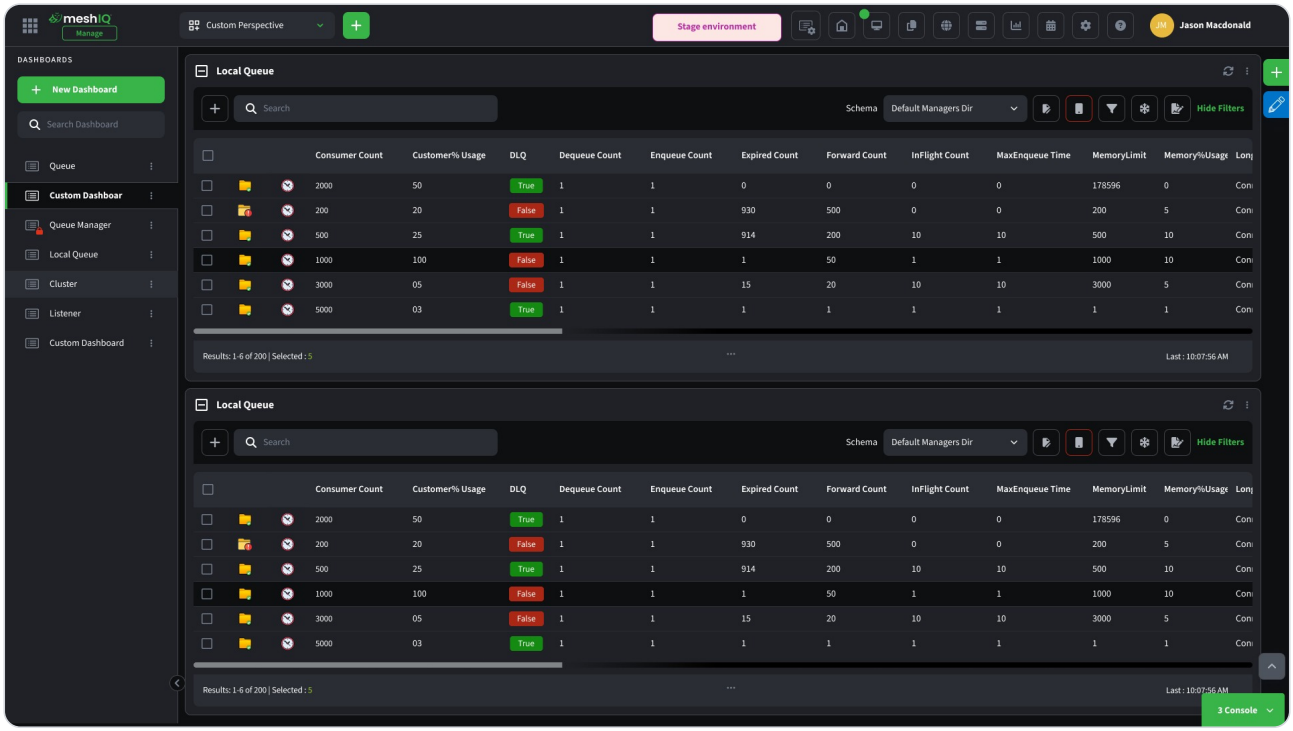

Manage home: one place for the whole integration infrastructure. Perspectives for ActiveMQ, Kafka and RabbitMQ give quick access, with getting-started help on the right.

Data-rich custom dashboards

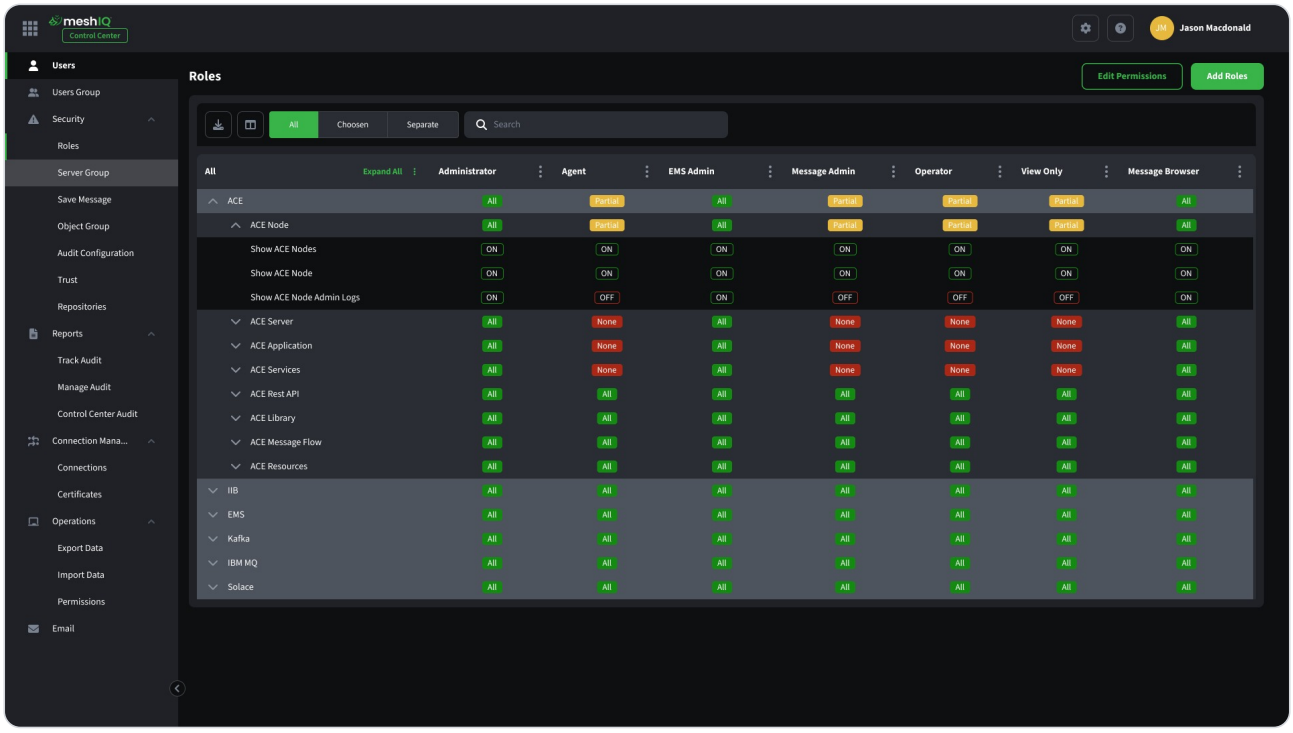

A custom dashboard in Manage combining KPI cards, bar and donut charts, a live Local Queue table and time-series charts for current and max depth.

Consistent table widgets

Dashboards can stack table widgets. Each has the same toolbar: search, schema selector, export, filters and clear True/False status chips.

Control Center: roles & permissions

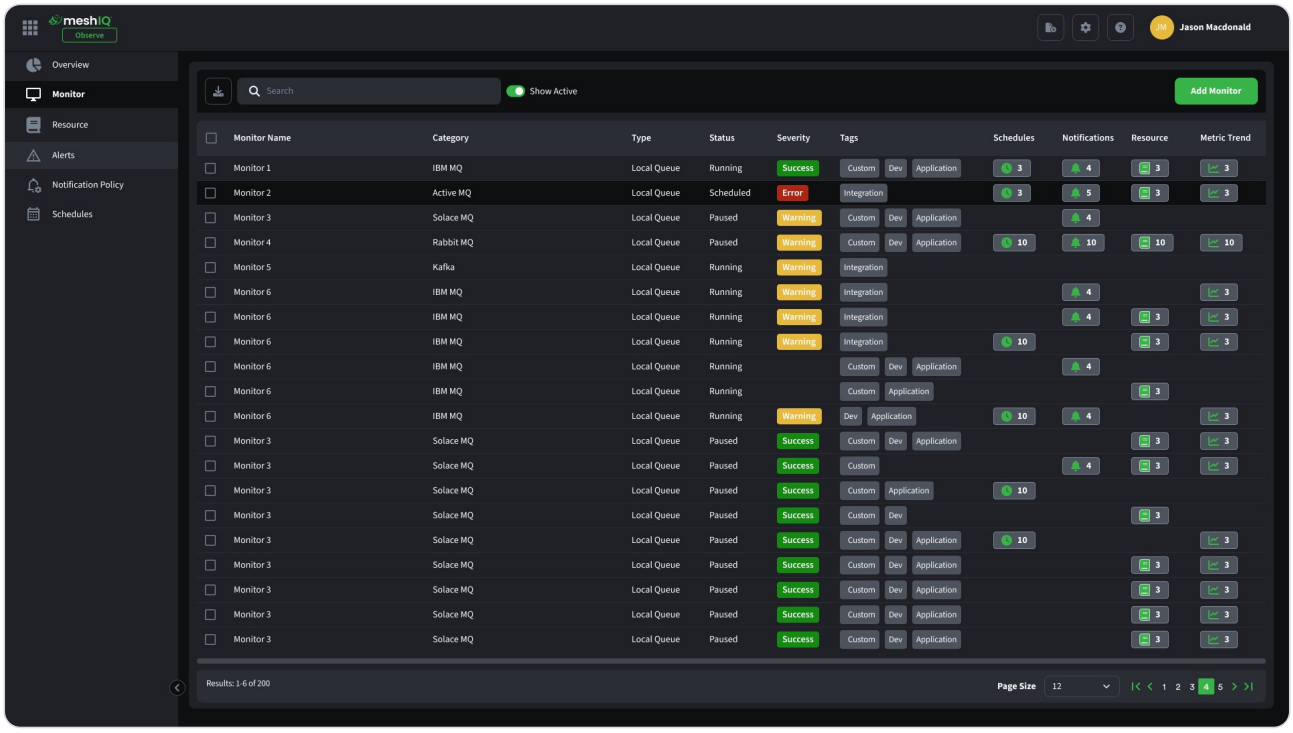

Control Center manages roles and permissions for every product in one matrix. All, Partial and None chips make access levels easy to scan.

Observe overview

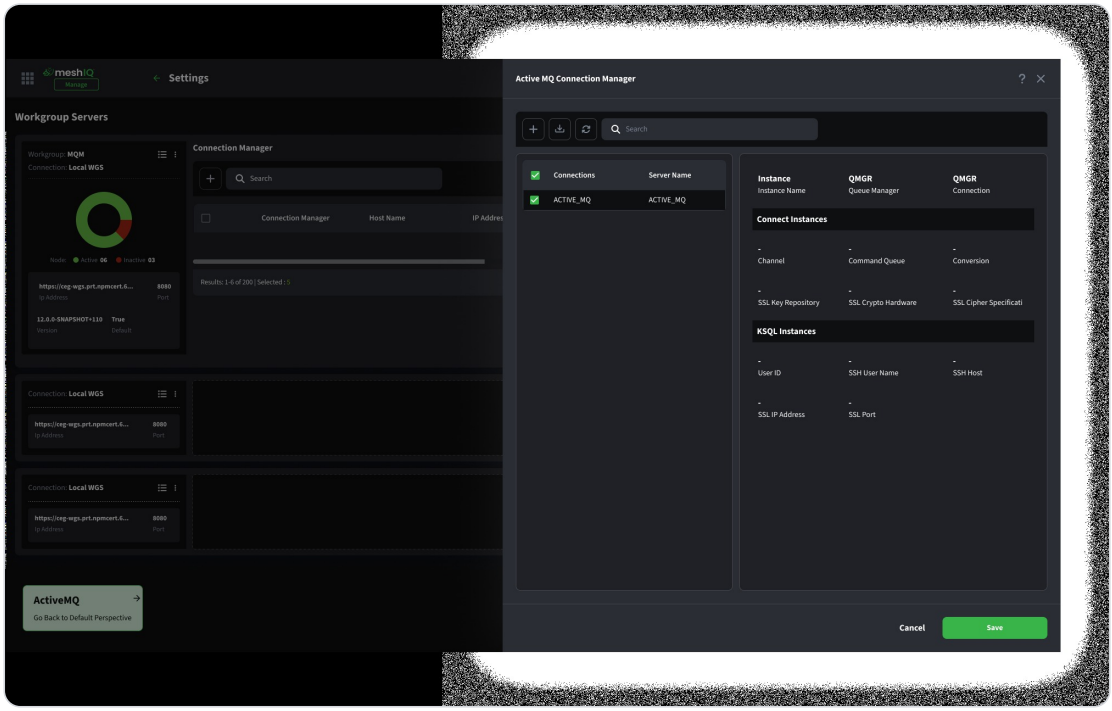

Observe overview: KPI cards link straight to monitors, resources, schedules, notification policies and alerts, followed by status, severity and alert charts.

Observe monitors

Monitor list with severity chips, tags and count badges, plus an Active toggle, search and pagination from the shared component library.

Connection Manager

The ActiveMQ Connection Manager opens as a side panel over Settings, so users can configure a connection without losing their place.

08 · OUTCOME

What changed

- meshIQ is now presented as **one unified platform** instead of a collection of separate products.
- Multi-product users get faster, simpler access through **one URL and SSO**.
- A **shared design system** creates consistency and speeds up future design and development.
- A modern, analytics-focused interface better reflects meshIQ's position as an **enterprise leader**.

09 · KEY LEARNINGS

Working without direct user research

Product knowledge as research

Without direct user research, deep product knowledge and customer feedback became the main sources of insight.

Systems before screens

A strong design system was essential for bringing several products together without losing what each one does best.

meshIQ

One platform. One login. One consistent experience.
